

PET from household recycling or production waste arrives at Dentis, where it is processed to become a secondary raw material.

The facility's current capacity is 40,000 tons a year, the equivalent of around 1.3 billion bottles. Dentis-recycled PET is called PETALO, and comes in the flakes typical of the recycled plastic.

A unique characteristic of PETALO is 100% homogenous crystallization, facilitating the production of new objects from the recycled material.
