eHealth Nigeria

eHealth Nigeria (USA/NIGERIA) is focused on improving healthcare in Northern Nigeria by creating effective ways to implement reliable health information management systems. The company has developed eHealth and mHealth software solutions that can be rapidly deployed to manage patient information, streamline clinical procedures, and provide data and analysis on health program outcomes. Accurate health data will provide NGOâ€™s, hospitals, and donor agencies with access to timely health system indicators needed to evaluate their health interventions and respond to critical public health needs. It brings about positive change by harnessing the potential of technology, valuing the power and knowledge of the Nigerian people, and maintaining a sharp focus on the health worker.
