

Spirulina Platensis can be cultivated for personal use in a basin. There are many ways of building an adequate basin depending on variables according to local conditions: out of plastic covers, hard clay, low walls. IIMSAM, Intergovernmental Institution for the use of micro-algae Spirulina against malnutrition, works to promote the use of Spirulina against severe malnutrition. It has been established through two international agreements that are recognized in the UN Treaty Series. IIMSAM is accredited as a Permanent Observer with the United Nations Economic and Social Council (ECOSOC).
