Open Value Network (OVN) is an approach to commons-based peer production.

Open Value Network (OVN) is an approach to commons-based peer production. It allows individuals and organizations to

co-create and aggregate value through lateral and large scale coordination, cooperation and collaboration

to serve as a responsible steward of commonly held wealth and assets

to account for various inputs and outcomes in a common ledger system

distribute value equitably and intentionally within and beyond the network

and to share returns amongst contributors, in proportion to their contributions.

The open value network model relies on p2p principles of co-production, self-organization, and stewardship of commons. peer production - the collaborative production of surplus value by means of common and contributed assets; peer governance - direction and accountability by the community of producers themselves, not by market allocation or corporate hierarchy; peer property - the use-value of property is accessible on a collective trust basis through new modes of ownership which are not exclusive, while recognizing individual authorship or title where appropriate. An OVN is a general model that can be implemented under different forms, adapted to specific contexts. See example with SENSORICA
